REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

\+ And also on a later date or dates.

• Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

SAN FRANCISCO: 1952

CALIFORNIA - FEBRUARY 1952

E. L. Felton, Section Director, San Francisco

WEATHER SUMMARY

The average temperature for the State based on 314 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 46.7° or 0.6° below the weighted mean. The unweighted average based on the same 314 stations was 47.0° or 0.1° below the unweighted mean. The highest temperature, 87°, occurred at El Cajon Yale Ranch on the 1st, and Indio U.S. Date Garden on the 6th. The lowest temperature, 23° below zero, was recorded at Boca in Nevada County on the 13th.

The average precipitation for the State based on 317 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 2.52 inches, or 1.34 inches below the weighted mean. The unweighted average based on the same 317 stations was 2.64 inches or 1.79 inches below the unweighted mean. Based on 543 stations listed in Table 3 the unweighted average precipitation was 2.67 inches or 1.76 inches below the unweighted mean. The greatest monthly total precipitation, 19.01 inches, was recorded at Strawberry Valley at an elevation of 3784 feet in Yuba County. Twenty-one stations, all in southern California reported no measurable precipitation; of these eleven had none. The greatest daily precipitation amount, 4.70 inches, occurred at Upper Mattole in Humboldt County on the 1st.

The snowpack in the Sierra Nevada increased during February. The maximum depth on the ground at Soda Springs, 218 inches, was unprecedented since records began at that location in March 1930. Snowfalls and maximum depths of snow on ground for many stations for the period of record since 1921 may be found on Page 45 in Table of Comparative Snowfalls and Maximum Depths on Ground for February.

Weather in the North Coastal area remained generally too wet for any large scale farming operations.

Warm weather in the Central Coastal area during the first half of the month was favorable for farming operations and development of crops. Early deciduous fruit buds started to swell and in some districts trees started to bloom. Rains during the last half of the month were unfavorable for spraying of apricot blossoms which were beginning to open in some districts.

Generally above normal temperatures during the first decade in the upper Sacramento Valley were very beneficial to range grasses and grains. Buds on fruit trees started to swell, and some trees came into blossom. The lack of precipitation from the 2nd to 10th permitted outdoor activities such as pruning, fence repairing, etc. Wet, cold weather from the 17th to 23rd retarded the rate of growth of crops and interrupted farming operations. Some losses in lambs were reported due to wet, cold weather conditions. Although buds on almond trees were swelling the cold weather was beneficial in retarding development until frost danger had decreased. Warm weather during the latter portion of the month hastened blossoming on many trees. Soils dried sufficiently in many places permitting long-delayed land-leveling operations.

Soils in the lower Sacramento Valley remained generally too wet for seeding operations and truck crop harvesting during the first week. Some pruning and spraying activities progressed in some districts during the middle portion of the month. Rains during the third week again interrupted most farm work. A thunderstorm accompanied by hail occurred in the Sacramento district on the 20th with about one-half inch of hail on the ground at Sacramento at 5:00 p.m. At Norden the maximum depth of snow on ground was reported as 251 inches. This was the greatest depth of record so early in the season and exceeded only by the record depth of 305 inches in March 1907 and March 1911 at that station. Warm weather during the last several days brought plums and almonds into full bloom.

Morning fogs in the lower San Joaquin Valley during the first decade interfered with the picking of the remaining cotton. Moderate temperatures and the absence of killing frosts benefited cover crops, grains, and range grasses. Rains during the second decade briefly interrupted farm work but favored cover crops, grains, and grasses.

Moderate temperatures in the upper San Joaquin Valley during the first decade were beneficial in drying soils sufficiently to permit tillage to start. Forage crops generally progressed during the month. Deciduous fruit tree buds swelled, and some early plums blossomed. Rains during the month were very helpful to grasses.

Fair weather in the Santa Maria area was generally favorable for crops. Rains during the latter half of the month were very beneficial to some hill pastures which were in need of more moisture.

Warm weather in the Los Angeles area during the first half of the month contributed to rapid growth of grains and pasture grasses and increased development of deciduous fruit tree buds. Saucer peaches and some flowering trees came into blossom in some districts. Cooler weather during the third week slowed growth of early spring vegetation. Light frosts occurred in some districts from the 18th through the 20th with no apparent damage;some light orchard heating was accomplished. Due to the lack of rainfall during the month topsoils became quite dry particularly in grain fields; some citrus was irrigated on light soils. Rains on the 29th were very beneficial to all vegetation, particularly grains and grasses.

Unseasonably warm, dry weather in the San Diego area during the first week contributed to rapid drying of topsoils. Maximum temperatures on the 5th and 6th at San Diego were the highest ever recorded on those dates at that station. Several showers during the last three weeks benefited grains and grasses.

Warm weather in the Imperial Valley during the first half of the month contributed to rapid growth of sugar beets, flax, and other crops. Plantings under hot caps made rapid progress.

HHE

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

+ And also on a later date or dates.

• Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

MARCH 1952
Volume LVI No. 3

SAN FRANCISCO: 1952

CALIFORNIA - MARCH 1952

E. L. Felton, Section Director, San Francisco

WEATHER SUMMARY

The average temperature for the State based on 315 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 46.4° or 5.3° below the weighted mean. Only two times since 1897 has the March average temperature been less than 46.4°; in 1917, 45.7°; in 1935, 46.1°. The unweighted average temperature based on the same 315 stations was 46.3° or 4.7° below the unweighted mean. The highest temperature, 93°, was reported at Indio U. S. Date Garden on the 27th. The lowest temperature, 27° below zero, was recorded at Boca in Nevada County on the 21st. The lowest temperature for the State has been equal to or lower than 27° below zero only two times since 1897; in 1906, 28° below zero; in 1917, 29° below zero.

The average precipitation for the State based on 317 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 4.98 inches or 2.06 inches above the weighted mean. The unweighted average based on the same 317 stations was 5.66 inches or 2.26 inches above the unweighted mean. Based on 540 stations listed in Table 3 the unweighted average precipitation was 6.01 inches or 2.61 inches above the unweighted mean. The greatest monthly precipitation, 19.83 inches, was reported from Palomar Mountain Observatory in San Diego County. The least monthly total precipitation, 0.07 inch, was recorded at Twentynine Palms in San Bernardino County. The greatest daily amount, 6.10 inches, occurred on the 15th at Gibraltar Dam in Santa Barbara County.

Generous snowfalls during the first two decades brought unusually great snow depths to the Sierra Nevada area. Maximum depths on ground during March 1952 were greater than any previously recorded maximums at many stations. The greatest monthly snowfall, 168.0 inches, was recorded at Grant Grove in Tulare County. Other heavy snowfalls were reported as follows: Snow Laboratory Central Sierra, 161.9 inches; Soda Springs, 155.5 inches; Twin Lakes, 136.0 inches; Huntington Lake, 144.0 inches; Giant Forest, 139.0 inches; Cisco Ranger Station, 137.8 inches; and Lodgepole Ranger Station, 158.2 inches. The greatest depth of snow on ground, 268 inches, was recorded at Soda Springs in Nevada County. Snowfalls and maximum depths of snow on ground for March for many stations since 1921 are given in Table of Comparative Snowfalls and Maximum Depths on Ground for March on page 69.

In the north coastal area farming operations remained generally at a standstill due to continued wet, cold weather. Below normal temperatures and wet weather were unfavorable for livestock, and many lambs died from exposure. Grasses in the hills were retarded due to low temperatures. During the latter portion of the month considerable sunshine and the very lightness of rainfall contributed to rapid evaporation of standing water; however, soils remained generally wet in most sections.

Wet, cool weather in the central coastal area during the first three weeks delayed crop development and planting of trees and vines. Heavy soils remained too wet for cultivation. Unusually warm weather during the last week contributed to rapid development of fruits and considerable orchard spraying and cultivation.

Rains and wet soils in the upper Sacramento Valley during the first two decades hindered operations, such as, tree planting, land leveling, etc. Below normal temperatures during the first three weeks were generally unfavorable for grains and grasses. Much above normal temperatures during the last week were very beneficial for crops and farming operations. Soils dried sufficiently to permit resumption of tilling and land leveling operations. Blossoms on fruit trees developed rapidly.

Heavy rains in the lower Sacramento Valley during the first two decades curtailed most farming operations. Soils remained too wet for weed control, spraying, and seeding activities. In the Marysville district strong winds on the 15th blew a few weak limbs from shade trees and tipped over a few orchard trees where soils were wet. In the Colusa district strong winds blew over prune and almond trees with losses estimated at $10,000. Strong winds in the Yuba district downed many trees, mostly almonds, with damages estimated at $5,000; doors, windows, power poles, etc., sustained damages estimated at $5,000. In the Auburn district some fruit trees were uprooted, and some blossoms blown from plum trees. Strong winds in the Woodland district uprooted trees and destroyed several barns. Winds in the Sacramento district damaged automobiles, residences, and other property to an extent of $20,000; muslin covering of tomato beds, growing tomatoes, and peas in fields sustained losses estimated at $10,000. In the Fairfield district a few ornamental and fruit and nut trees were blown down; some buildings were damaged. Cold, wet weather somewhat retarded development of lambs. Drying, north winds togethe with much above normal temperatures during the last wee hastened drying of heavy soils; however, poorly draine soils in the Delta region still remained too wet for culti vation and planting activities. In some districts soil dried too quickly with crusting hindering small plants fro breaking through.

Recurring rains and strong winds in the lower San Joaqui Valley during the first two decades were generally detri mental to farming operations. Strong winds on the 14th an 15th blew many blossoms off almond, prune, peach, and apri cot trees, greatly reducing the number of small green fruits In the Lodi section a 15-acre almond orchard sustained loss of about 60 percent of the trees; similar reports wer received for other orchards in this section. In the Modest district lashing winds pushed down almost entire orchards The Modesto Airport recorded a loss of $6,000 when fou light planes were overturned. In Stockton and San Joaqui County strong winds resulted in damages estimated at on million dollars. The storm was described as the worst sinc 1938 in this section. The Pacific Gas and Electric Compan reported three cases of major transmission trouble and a least thirty main circuit lines down. The Pacific Telephon and Telegraph Company reported at least 150 of its line severed by falling limbs, trees, power poles, etc. Man roofs were blown off, windows smashed, television antenna wrecked, signs buckled, etc. In the Sonora district stron winds downed a few trees. Low temperatures during the firs three weeks slowed growth of range grasses, grains, an cover crops. Frosts on the 20th and 21st resulted in wide spread orchard heating, and very little damage was sustained Unusually high temperatures during the last week were ver favorable for crops and farming activities. Developmen of vines and trees was hastened with most vines leafing an many fruit trees approaching this stage. Grains and grass es made rapid growth.

Rains and much below normal temperatures in the uppe San Joaquin Valley during the first three weeks generall brought farming activities and crop development to a vir tual standstill. Shearing of sheep was also held up by th weather which delayed their return to pastures at highe elevations. Higher temperatures during the last week con tributed to rapid development of crops.

Rains in the Santa Maria area were of considerable bene fit to some hill pastures which were in need of more mois ture. Potato harvesting operations were delayed about thre weeks, and growth of lettuce and endive was slowed consider ably due to the cool, wet weather. Excessive moisture con tributed to some mildew in lettuce. During the last wee ideal weather prevailed for growing crops.

Rains in the Los Angeles area during the first two de cades were very beneficial for all vegetation, particularl grains and grasses. Deciduous and citrus fruit buds devel oped slowly due to the cool weather. Some scattered earl deciduous fruits reached the blossom stage and sustaine some damage due to the rains. Wet, cold weather contribute to considerable splitting of cabbage. Heavy rains on th 6th with totals in excess of three inches in 18 hours pro duced heavy runoff from hard-surfaced areas. Damages re sulting from the heavy rains and strong winds were reporte as follows: automobiles, $3,000; streets, $15,000; and tree $2,000. From the 14th to 16th heavy rains and strong wind resulted in flooding, erosion, silting, mud slides, an damage to trees and power poles. Losses were estimated a follows: buildings, $20,000; automobiles, $5,000; and street $25,000. Sunny weather with drying winds during the las decade was beneficial for vegetation and drying topsoils Higher temperatures favored blooming of deciduous fruits.

Rains in the San Diego area during the first two decade generally benefited crops. Despite the general lack o adequate precipitation during February, grains and grasse remained in good condition. Avocado and lemon harvesti activities were delayed by rains and wet soils. Some sca ring of avocados was reported due to strong winds, bu otherwise little damage was sustained. Higher temperature would have been more favorable for plantings of cucumbers peppers, tomatoes, squash, etc. Deciduous trees blossom slowly. Unseasonably warm weather during the last wee resulted in rapid growth of cucumbers, peppers, squash, an tomatoes. Soils dried rapidly, and picking of avocadoes an lemons was resumed on a large scale. Peaches and pears an other deciduous fruits bloomed heavily at lower elevations

Melons, cantaloupes, tomatoes, and squash in the Imperi Valley developed slowly due to cool weather during the firs three weeks. Warmer weather during the last week favore development of all crops.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

\- No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

\+ And also on a later date or dates.

• Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

COLORADO

APRIL 1952
Volume LVII No. 4

SAN FRANCISCO: 1952

COLORADO - APRIL 1952

A. W. Cook, Section Director, Denver

WEATHER SUMMARY

Seasonal weather prevailed throughout April with normal precipitation and temperatures only slightly above. Some fresh to strong winds, causing limited soil movement over the eastern plains was the only unusual feature of the month.

Clear to partly cloudy skies predominated until the 8th, with limited and widely scattered showers over the northeast portion, and the most pronounced temperature excesses of the month near the close of the period. Somewhat subnormal temperatures and generally well-distributed precipitation prevailed from the 9th until mid-month. Temperature fluctuations were moderate for the remainder of the month with heavy precipitation east of the Continental Divide and light scattered showers elsewhere at the close of the second decade. Near the end of the month, precipitation was again general over most of the State with the greater amounts recorded in the southwest portion.

The monthly mean temperature, 44.6°, was 0.7° above normal, with all sections showing slight excesses. The monthly maximum, 90°, occurred at Eversoll Ranch, Baca County, on the 7th, and the State minimum, -21°, at Taylor Park, Gunnison County, on the 1st. Precipitation was normal with a weighted average of 1.73 inches. The Colorado River basin showed a deficiency, while elsewhere slight excesses prevailed. The Lake Moraine station, El Paso County, recorded the greatest monthly amount, 5.34 inches, and Walden the least with only 0.05 inch. The greatest 24-hour amount, 2.75 inches, was recorded at Wetmore 8 SW, on the 21st.

The month was generally favorable for agricultural activities; soil preparation an planting progressed at a normal rate. A the close of the period, soils were in goo shape and planting well under way. The heav winter snow cover had delayed activities i the higher elevations of the western slope Winter wheat and barley made satisfactor progress and the crop outlook was excellen in the Platte and Kansas River Valleys, goo over the western slope, and fair to goo elsewhere. Planting of spring grains an early row crops was general with averag showing as the month progressed. Ranges an pastures improved somewhat but were in onl fair condition. Livestock wintered well calving and lambing were well advanced wit good increases and very light losses due t adverse weather conditions. Some herds wer moving to summer ranges. The fruit crop out look was good with buds in various stage from the late pears and apples showing colo to peaches, cherries, and plums and othe early fruit in full bloom. Reports on irri gation and storage water indicated abundan supply, and subsoil moisture improved, es pecially in the Arkansas River Valley.

SEVERE STORMS

On the 3rd near Haswell, soil laden winds reaching gale velocities at times, prevaile over an area of 1300 square miles for a per iod of 10 hours. The resulting damage wa limited to winter grains and newly plowe farm land.

WMW

† 1 ARKANSAS, 2 COLORADO, 3 KANSAS, 4 PLATTE, 5 RIO GRANDE.

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F. Evaporation is measured in the standard Weather Bureau type pan of 4 feet diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 5:30 p.m., MST.

- No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

/ Gage is equipped with a windshield.

.R This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.

S Storage precipitation station. Precipitation measurement, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

S This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

R This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WEATHER SUMMARY

The average temperature for the State based on 317 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 65.1° or 2.0° above the weighted mean. The unweighted average temperature based on the same 317 stations was 63.2° or 1.9° above the unweighted mean. Palm Springs, in the Coachella Valley, reported the highest temperature for the State, 115°, on the 24th. Twin Lakes, in Alpine County, recorded the lowest temperature, 16°, on the 8th.

The average precipitation for the State based on 324 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.37 inch or 0.43 inch below the weighted mean. The unweighted average based on the same 324 stations was 0.38 inch or 0.52 inch below the unweighted mean. Based on 549 stations listed in Table 3 the unweighted average was 0.42 inch or 0.48 inch below the unweighted mean. Vollmers, in Shasta County, reported the greatest monthly total precipitation, 4.05 inches. Two hundred sixty-two stations, mostly in southern California, reported no measurable precipitation. The greatest daily amount, 2.70 inches, was reported from Tennant in Siskiyou County on the 7th.

Moderate precipitation in the north coastal area during the first week slowed farming activities and left soils quite wet in low places. Garden vegetables made satisfactory progress and remained in excellent condition.

Warmer weather in the central coastal area during the first week would have been more beneficial for most crops. Below-freezing temperatures in the Napa Valley on the 5th resulted in considerable damage to grapes and some slight damage to prunes and walnuts. Well-above-normal temperatures during the third week were beneficial for all crops but increased the need for more moisture.

Rains in the upper Sacramento Valley on the 6th and 7th wet some hay but resulted in very little damage. Much-above-normal temperatures during the last half of the month contributed to rapid advance of all crops and benefited haying operations but made considerable irrigation necessary in pastures, meadows, and truck crops.

Rains in the lower Sacramento Valley during the first week damaged some hay and contributed to some splitting of early cherries. Irrigation was started in sugar beet fields in Yolo and Solano Counties where showers did not occur. The continued cool weather resulted in a lag in the development of all crops. Below-freezing temperatures in some spots in the Delta region on the 4th damaged potatoes, asparagus, and some small tomato plants. Drying, north winds and high temperatures contributed to pinching of barley heads. Irrigation was required in sugar beet fields and orchards as a result of the dry weather.

Below-normal temperatures in the lower San Joaquin Valley during the first week generally retarded development of crops. Strong winds on the 19th resulted in considerable damage to crops and property. A short crop of plums sustained over-all losses estimated at 15 to 20 percent. In one fig orchard of fairly shallow soil over hardpan which had just been irrigated, many trees were uprooted. Some cotton sustained sand blasting. Some shoots on grapevines were removed by the wind. Many ornamental trees were downed and thousands of branches littered streets and roads, some of which were temporarily blocked. Power lines were reported broken and windows shattered.

Abundant sunshine and above-normal temperatures in the upper San Joaquin Valley during the latter half of the month contributed to rapid development of all crops.

Pastures in the Santa Maria area were generally reported in good condition with considerable feed, but due to lack of moisture were continuing to dry. Ideal condition generally prevailed for the development of all crops.

Above-normal temperatures and abundant sunshine in the Los Angeles area were favorable for crops. Conditions were ideal for curing and harvesting of grains and hay, germination and rapid development of warm weather crops, particularly lima beans. Irrigation was in full swing in many districts.

Well-above-normal temperatures in the San Diego area favored rapid ripening of Valencia oranges. Early plantings of tomatoes, cucumbers, and squash also made rapid progress. Conditions were generally favorable for all harvesting activities. Ranges continued in good condition but manifested some drying.

In the Imperial Valley above-normal temperatures benefited all crops. By the end of the month squash, sweet corn, and tomatoes were maturing in large quantities.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office

Observation times given in the Station Index are in local standard time

Delayed data and corrections will be carried only in the June and December issues of this bulletin

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are Temperatures in °F., precipitation and evaporation in inches and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949

Amounts in Table 3 are from non-recording gage, unless otherwise indicated

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation See the Station Index for observation time

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations For these stations snow on ground values are at 4 30 p.m., PST.

- No record in Table 3, 6, 7 and the Station Index No record in Tables 2 and 5 as indicated by no entry

+ And also on a later date or dates.

• Amounts included in following measurement, time distribution unknown

// Gage is equipped with a windshield

AR This entry in time of observation column in Station Index means after rain

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall

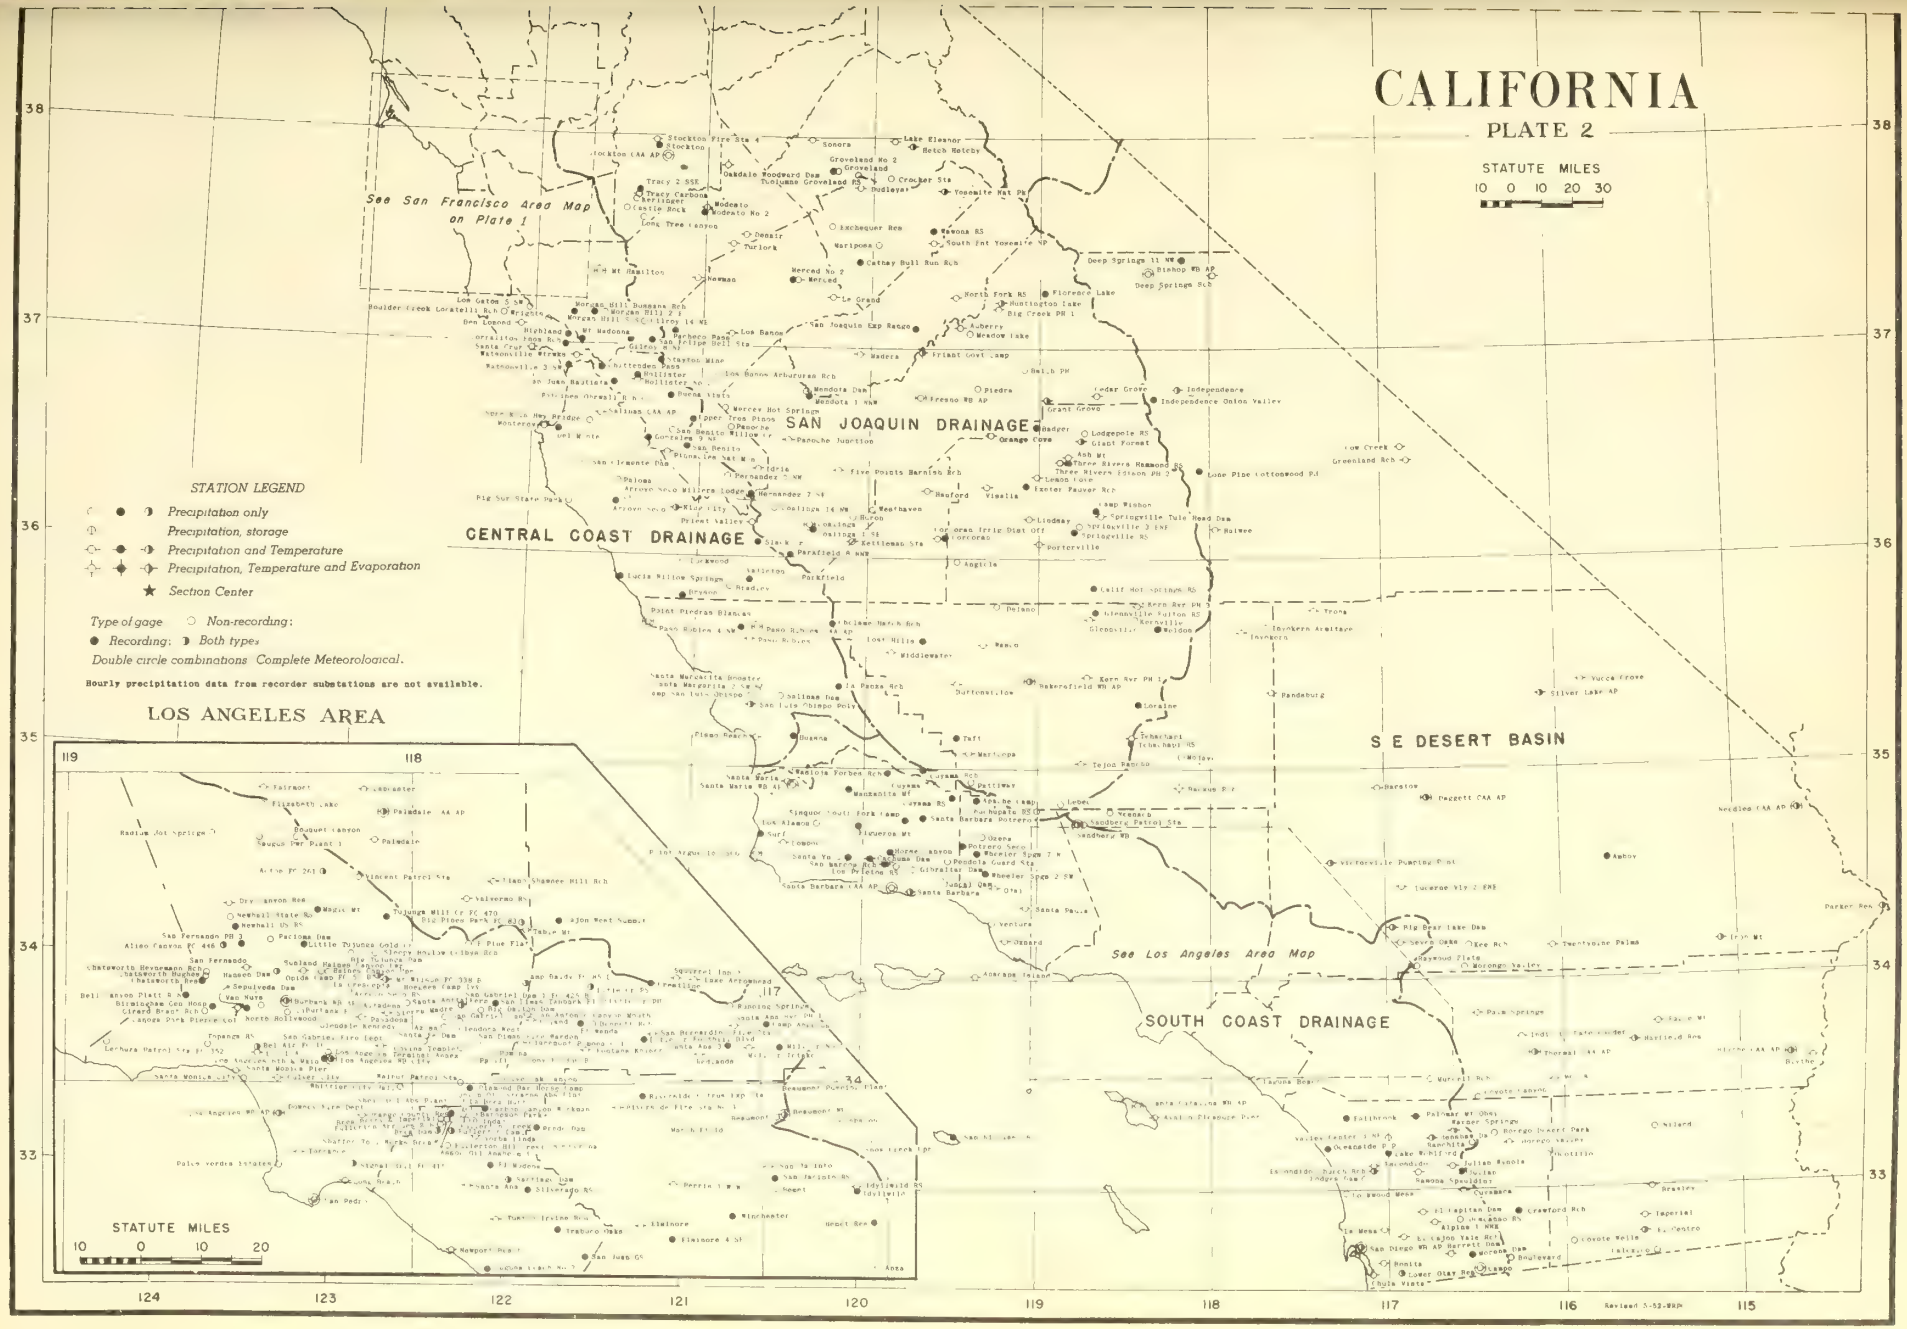
M One or more days of record missing; see Table 5 for detailed daily record Degree Day data, if carried for this station have been adjusted to represent the values for the full month

R Daily values and monthly total from recording gage All other data in Table 3 are from non-recording gage.

S Storage precipitation station Precipitation measurements, made at irregular intervals, will be published in the June, July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.



V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable

Subscription Price: 15 cents per copy, monthly and annual; $1 50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

Volume LVI No. 6

SAN FRANCISCO: 1952

CALIFORNIA - JUNE 1952

E. L. Felton, Section Director, San Francisco

WEATHER SUMMARY

The average temperature for the State based on 325 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 65.7° or 4.2° below the weighted mean. The unweighted average temperature based on the same 325 stations was 63.4° or 4.3° below the unweighted mean. This was the lowest unweighted June average temperature since 1923. The 62.9° average recorded for June 1923 was the lowest of all averages computed since 1897. The highest temperature for the month, 114°, was reported at Cow Creek on the 17th and Greenland Ranch on the 18th. Boca in Nevada County recorded the lowest temperature, 19°, on the 12th.

The average precipitation for the State based on 326 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.60 inch, or 0.29 inch above the weighted mean. The unweighted average based on the same 326 stations was 0.60 inch, or 0.27 inch above the unweighted mean. Based on 542 stations listed in Table 3, the unweighted average was also 0.60 inch. Alturas Ranger Station in Modoc County reported the greatest monthly total precipitation, 4.63 inches. No measurable precipitation was reported from 223 stations mostly in southern California. The greatest daily precipitation amount, 2.10 inches, was recorded at Cazadero in Sonoma County on the 28th.

Rains in the north coastal area during the first three weeks were generally too light to be of much benefit to crops. Ranges were generally reported in good condition but in need of additional rainfall. Rains during the last week reduced fire hazards in forests and benefited ranges and some growing crops. Hay, however, sustained considerable damage.

Weather in the central coastal area was generally cool but not detrimental to crops. Pastures continued to dry and some crops required irrigation due to the lack of sufficient rainfall. Strong winds on some days were somewhat unfavorable for fruit crops. Some fruits were blown from trees, and the apricot drop was reported greater than usual. Below-freezing temperatures on the 12th in some portions of Lake and Sonoma Counties nipped tender crops. Higher temperatures during the month would have been more favorable for tomatoes, squash, cucumbers and other crops. Apricots in Santa Clara County ripened very slowly as a result of below-normal temperatures.

Warm weather in the upper Sacramento Valley during the first week was beneficial for haying operations and maturation of grain crops. The desiccating effect of low relative humidities made considerable irrigation necessary. Showers on the 6th were unfavorable for haying operations and grain harvesting. Much-below-normal temperatures during the second week retarded growth of pasture grasses and development of early peaches but reduced irrigation water requirements. Rains during the last week temporarily interrupted grain harvesting, and much-below-normal temperatures again slowed ripening of early varieties of peaches. Ranges, pastures, and alfalfa crops generally benefited from the rains.

Below-normal temperatures in the lower Sacramento Valley were generally not favorable for sugar beets, rice, tomatoes, truck crops, and fruits. Many cool nights and afternoons retarded the proper setting of tomatoes and delayed the maturing of orchard fruits. Dusting operations were restricted due to strong winds on some days and the lack of fuming temperatures in afternoons. The minimum temperature of 44° in Sacramento on the 12th was the lowest temperature ever recorded so late in the season and was within 1° of the lowest temperature on record for the month of June at that station. At Sacramento this was the coolest June since 1923.

Cool,humid weather in the lower San Joaquin Valley contributed to considerable mildew in vineyards. Much-below-normal temperatures retarded ripening of early fruits and slowed development of cotton and truck crops. Greater-than-normal wind speeds on many days generally hindered farming operations such as crop dusting, hay cutting, and hay baling. At Fresno this was the coolest June since 1894.

Warm weather in the upper San Joaquin Valley during the first week was favorable for crops. High temperatures and abundant sunshine hastened ripening of plums and favored development of cotton. Much-below-normal temperatures during the second and fourth weeks slowed the growth of cotton. The average temperature at Bakersfield for June 1952, 71.8°, was the lowest since 1923.

The lack of adequate rainfall in the Santa Maria area during the month contributed to drying of ranges and pastures. Some foggy mornings and light precipitation contributed to some sliming of lettuce and some damage to strawberries. Generally the lack of warm weather was beneficial for most crops.

Cool, cloudy, damp weather in the Los Angeles area during the first decade was favorable for beans and newly transplanted tomatoes but somewhat unfavorable for curing and harvesting of grain crops. Warm, dry weather around the middle of the month benefited growing and maturing crops. Harvesting and pest control operations progressed under these favorable conditions. Cool, cloudy weather during the last week generally retarded development of crops with the exception of beans.

Weather in the San Diego area was generally favorable for crops; however, below-normal temperatures during the last decade slowed development of tomatoes.

In the Imperial Valley crops matured rapidly as a result of the warm weather.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperatures in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7 (when published) are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 p.m., PST.

- No record in Table 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

+ And also on a later date or dates.

° Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station have been adjusted to represent the values for the full month.

R Daily values and monthly total from recording gage. All other data in Table 3 are from non-recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July and August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

AUGUST 1938 through APRIL 1952	Neenach, delete all temperature data.
MAY 1949 through DECEMBER 1950	Coleville, record should have been published under the name of Coleville 4 SE
MARCH and APRIL 1950	Snow Lab. Central Sierra, all hourly precipitation from 6 p.m. March 16th to 9 p.m. April 13th should be one hour later.
JANUARY 1951	Fort Bragg, precipitation departure should be 2.47.
	Healdsburg, precipitation departure should be -2.87.
	Hollister, precipitation departure should be -1.19.
	Pomona, precipitation departure should be -.99.
	Sierraville RS, precipitation departure should be 1.04.
FEBRUARY 1951	Fairmont, precipitation departure should be -3.20.
	Hamilton Field, precipitation departure should be -2.77.
	Lodi, highest temperature should be 68° on 8th, lowest 25° on 1st and days with 32° or below, 5.
	Opid's Camp FC 57B, precipitation departure should be -8.13.
MARCH 1951	Raywood Flats, delete all temperature data.
MAY 1951	Iron Mountain, precipitation departure should be .19.
JUNE 1951	Culver City, precipitation departure should be .00.
	Volta PH, precipitation departure should be -.92.
JULY 1951	Bridgeport Dam, precipitation departure should be -.47.
	Redlands, precipitation departure should be -.09.
OCTOBER 1951	Scotia, precipitation departure should be 1.90.
NOVEMBER 1951	Clarksburg, precipitation departure should be 2.15
	Corcoran Irrigation District, Table 3, monthly total should be 1.01.
	Fresno WB AP, Table 3, monthly total should be 1.03.
DECEMBER 1951	Lodi, precipitation departure should be 2.66.
	Redwood City, precipitation departure should be 5.50.
	Soda Springs, snowfall on 31st should be 8.0 and monthly total, 178.0.
ANNUAL 1951	Freeze Data, Table 3, number of days between dates, 32° or below, for the following stations should be: Blythe AP, 292; Centerville PH, 206; Crescent City, 270; Crescent City CAA AP, 256; Deer Creek PH, 156; Riverside Fire Station 3, 279; San Antonio Canyon Mouth, 278; Squirrel Inn 2, 161; Turntable Creek, 285.
	Kettleman Station, annual precipitation total should be 4.70.
	White Rock, annual precipitation departure should be 2.37.
JANUARY 1952	Big Tujunga Dam, precipitation on 17th should be .72, monthly total, 16.76
	Pismo Beach, the following temperatures, on the dates indicated, should be: Max., 1st, 52°; 2nd, 50°; 3rd, 54°; 17th, 55°; Min., 1st, 35°; 2nd, 38°; 10th, 34°; 11th, 39°. Mean max. should be 58.8°, mean min., 40.4°, mean, 49.6°; highest, 71° on 27th and total degree days, 470.
	Redwood City, mean min. should be 54.4°, mean, 46.6° and departure, -1.9°
	Santa Paula, add accumulated precipitation (*) for the 25th and 26th, .74. Monthly total should be 12.07, departure, 8.39, greatest day, 4.85 on 16th and days with .01 or more, 12.
	Soda Springs, total snowfall should be 245.0.
MAY 1952	Greenland Ranch, see Delayed Data for Corrected Data on Tables 2 and 5. Observation time for May 1952 record 8 a.m.

CLIMATOLOGICAL DATA

CALIFORNIA

JULY 1952
Volume LVI No. 7

SAN FRANCISCO: 1952

CALIFORNIA - JULY 1952

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 324 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 76.2° or 0.3° above the weighted mean. The unweighted average temperature based on the same 324 stations was 73.6° or equal to the unweighted mean. Cow Creek in Death Valley reported the highest temperature for the State with a maximum of 122° on the 16th and 17th. Mount Hebron Ranger Station in Siskiyou County recorded the lowest temperature, 30°, on the 1st. Julian Wynola in San Diego County recorded a low temperature of 30° on the 13th.

The average precipitation for the State based on 325 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.31 inch or 0.20 inch above the weighted mean. The unweighted average precipitation based on the same 325 stations was 0.27 inch or 0.18 inch above the unweighted mean. Based on 545 stations listed in Table 3, the average precipitation was 0.22 inch or 0.13 inch above the unweighted mean. Cedar Grove in Fresno County reported the greatest monthly total precipitation, 2.75 inches. Big Bear Lake Dam in San Bernardino County recorded the greatest daily precipitation, 1.95 inches, on the 25th. Two hundred fifty stations scattered throughout the State reported no measurable precipitation.

The lack of adequate rainfall in the north coastal area resulted in a general drying of ranges. Irrigation was necessary on farms.

Warm weather in the central coastal area was generally favorable for crops.

Much-above-normal temperatures in the upper Sacramento Valley favored ripening of peaches and rapid development of field crops. Considerable irrigation was necessary in pastures and meadows. Generally favorable weather conditions prevailed for grain harvesting.

Above-normal temperatures in the lower Sacramento Valley favored rice, tomato, and sugar beet development. Orchard fruits matured very rapidly due to the high temperatures. High relative humidities on many days favored an increase of mildew, blight, and aphids. The total precipitation at Sacramento of 0.01 inch was the greatest amount recorded at that station in July since 1925

Warm, humid weather in the lower San Joaquin Valley was favorable for the development of mildew in vineyards; however, winds were generally light enough for dusting operations for the checking of mildew. High temperatures hastened the development of tomatoes, bell peppers, cantaloupes, watermelons, and other crops. The minimum temperature of 77° at Fresno on the 29th was the highest minimum ever recorded at that station on that date.

Hot, humid weather in the upper San Joaquin Valley was ideal for sweet corn. Cotton also made rapid progress. An earthquake on the 21st resulted in broken irrigation pipes, caved-in water wells, damaged buildings, roads, and farm equipment, and undoing of level land surfaces. In some instances it was necessary to dig new wells or open old wells. Losses to agriculture were estimated at nearly a million dollars. Watering places for livestock were changed in some instances; that is, the flows of some springs were stopped, and flows of new springs in new places were started.

Weather in the Santa Maria area was generally favorable for most crops. Foggy conditions in the Santa Barbara district, however, contributed to some blight in walnuts. Some sliming of lettuce was reported.

Warm weather in the Los Angeles area was generally favorable for growing, maturing, and harvesting crops; however, some scalding of tomatoes and walnuts was reported as a result of hot weather during the last week. High temperatures were somewhat unfavorable for beans. Irrigation water requirements were increased, and pest control activities decreased, due to the well-above-normal temperatures.

Cool weather in the San Diego area during the first two decades resulted in a slower development of tomatoes. Warmer weather during the last decade favored rapid ripening of tomatoes. High temperatures on some days interrupted some spraying of citrus trees but favored rapid ripening of Elberta peaches.

Hot weather in the Imperial Valley favored rapid development of cotton.

HHE

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent to snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

CALIFORNIA

AUGUST 1952
Volume LVI No. 8

SAN FRANCISCO: 1952

CALIFORNIA - AUGUST 1952

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 318 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 75.3° or 0.5° above the weighted mean. The unweighted average temperature based on the same 318 stations was 72.5° or 0.1° below the unweighted mean. Cow Creek in Death Valley reported the highest daily maximum temperature, 122°, on the 4th. The lowest daily minimum temperature, 26°, was recorded at Portola in Plumas County and Boca in Nevada County on the 27th.

The average precipitation for the State based on 324 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.03 inch or 0.14 inch below the weighted mean. The unweighted average based on the same 324 stations was 0.02 inch or 0.11 inch below the unweighted mean. Based on 545 stations listed in Table 3 the unweighted average was 0.02 inch or 0.11 inch below the unweighted mean. Harrison Gulch Ranger Station in Shasta County reported the greatest monthly total precipitation, 1.43 inches. Harrison Gulch Ranger Station also recorded the greatest daily total, 1.35 inches, which occurred on the 2nd. Four hundred ten stations reported no precipitation, and fifty-seven stations reported only a trace.

The lack of precipitation in the north coastal area made considerable irrigation necessary.

Warm weather in the central coastal area during the first and third weeks hastened ripening of apples and other fruits.

Above-normal temperatures and the lack of precipitation made considerable irrigation necessary in the upper Sacramento Valley but favored hay-drying and fruit-picking activities.

High temperatures and high relative humidities in the lower Sacramento Valley favored mildew in grapes and peaches but generally benefited other crops and harvesting activities. High temperatures favored fuming of sulphur dusted on crops to control fungi.

Warm, humid weather in the lower San Joaquin Valley was generally favorable for all crops. Cotton made considerable growth, and melons and tomatoes ripened rapidly. Light winds together with the above-normal relative humidities were favorable for hay-baling operations.

Weather in the upper San Joaquin Valley was favorable for all crops. Cotton continued to make rapid progress.

In the Santa Maria area some "sliming" and "pitburn" was reported in lettuce due to some warm weather and foggy mornings. Generally, however, conditions were ideal for all crops.

Well-above-normal temperatures in the Los Angeles area resulted in rapid development of Valencia oranges and generally favored spraying operations. Peaches, tomatoes, beans, and other crops matured rapidly. Cool, foggy mornings in coastal districts were ideal for growing and harvesting truck crops.

Seasonable weather prevailed in the San Diego area during the greater portion of the month. Well-above-normal temperatures occurred during the last seven days.

Crops and harvesting activities in the Imperial Valley progressed under favorable weather conditions.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4 30 a.m., PST.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

+ And also on a later date or dates.

• Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent to snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing: see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

WEATHER SUMMARY

The average temperature for the State based on 323 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 71.8° or 2.3° above the weighted mean. The unweighted average based on the same 323 stations was 70.2° or 2.4° above the unweighted mean. The highest temperature for the State, 118°, was recorded at Cow Creek on the 1st, 2nd, and 3rd, Greenland Ranch on the 1st and 3rd, and Indio U. S. Date Garden on the 3rd and 4th. The lowest temperature, 22°, occurred at Boca on the 10th and Truckee Ranger Station on the 11th.

The average precipitation for the State based on 328 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 0.36 inch or 0.04 inch below the weighted mean. The unweighted average based on the same 328 stations was 0.32 inch or 0.07 inch below the unweighted mean. Based on 550 stations listed in Table 3 the unweighted average was 0.29 inch or 0.10 inch below the unweighted mean. Big Bear Lake Dam in San Bernardino County reported the greatest monthly total precipitation, 2.78 inches, and also the greatest daily precipitation amount, 2.17 inches, on the 19th. Seventy-five stations reported a total precipitation of none, and 64 stations reported a trace.

Precipitation in the north coastal area during the second week benefited field crops and vegetables. Generally, however, fields and ranges were very dry except where irrigated.

Above-normal temperatures in the central coastal area were favorable for harvesting of fruits and other crops.

Much-above-normal temperatures in the upper Sacramento Valley during the first several days were favorable for ripening of peaches and prunes. High temperatures together with low relative humidities made considerable irrigation necessary in pastures and field crops. Scattered showers during the second week resulted in some light damage to drying prunes. Clearing weather following the showers was very beneficial for keeping losses at a minimum. Much-above-normal temperatures during the last week resulted in some sunscalding of tomatoes but benefited fruit-drying and hay-curing operations. The maximum temperature of 105° on the 19th and 103° on the 30th at Red Bluff were the highest maximum temperatures ever recorded on those dates, respectively, at that station.

Warm weather in the lower Sacramento Valley during the first week benefited rice and tomatoes. Dew on some nights was favorable for haying operations. Some windiness during the first decade contributed to some shattering of unharvested seeds in Solano County. Warmer weather during the second week would have been more beneficial for rice and tomatoes. Very hot weather during the last week resulted in some sunscalding of tomatoes. The maximum temperature of 100° recorded at Sacramento on the 25th was the highest maximum ever recorded on that date at that station. Three inches of snow measured at Norden, near Donner Summit, on the 11th was the earliest snowfall since records began in 1898. Traffic near Donner Summit was interrupted several hours as a result of this snowstorm.

Warm weather during the first several days in the lower San Joaquin Valley was ideal for development of field crops and ripening of fruits. Cotton generally made rapid growth. Much-below-normal temperatures together with high relative humidities during the second week contributed to some splitting of Calimyrna and Adriatic figs. Some wilt in cotton plantings was also reported, due to the foregoing weather conditions. Light precipitation on the 19th resulted in considerable inconvenience to raisin drying interests. Many farmers found it necessary to roll and stack drying raisins. Warm, sunny weather following the rain contributed to minimizing losses. Much-above-normal temperatures during the last week were ideal for raisin drying. Excellent progress was reported in turning of trays and the rolling and boxing of raisins. The general absence of dew made the use of hygroscopic dusts necessary in cotton defoliating activities. Harvesting of the fifth crop of alfalfa was impeded by the lack of sufficient dew. The minimum temperature of 44° recorded at Fresno on the 11th was the lowest temperature ever recorded so early in the season at that station.

Light showers in the upper San Joaquin Valley during the second week resulted in some slight damage to alfalfa seed. Gusty winds accompanying the showers resulted in shattering of some seed on the ground. Heavy dew was generally favorable for cotton defoliation activities. Much-above-normal temperatures during the last week generally nullified any detrimental effects from light showers during the last week.

Weather in the Santa Maria area was generally favorable for all crops, except that above-normal temperatures together with fog in mornings contributed to some slime in lettuce.

Much-above-normal temperatures in the Los Angeles area during the first week contributed to rapid maturing of all crops but increased irrigation water requirements and interrupted pest-control operations. Sunscalding of tomatoes and damage to tender foliage was reported. Rain on the 19th interrupted lima bean threshing and haying activities but benefited fall vegetables and moistened some soils for fall grain planting. Hot weather on the 21st and 22nd again resulted in increased irrigation water requirements and interruption of pest-control operations. The average monthly temperature, 74.3°, at Los Angeles was the second highest for September since records began at that station.

The most unusual feature of the weather in the San Diego area was the long warm spell which ended on the 7th. At San Diego a period of 14 consecutive days with maximum temperatures exceeding 80° ended on the 7th. The previous record at that station for consecutive days with maximum temperatures above 80° was 11 days. Above-normal temperatures contributed to rapid development and ripening of crops. Showers during the last week contributed to some slight damage to ripe tomatoes. Generally favorable weather conditions prevailed for harvesting and planting activities.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a State.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensions, units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Weather Bureau Stations where hours of duty prelude observations at this time in which case the time is 10:30 a.m., PST.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent to snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual, $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

See note concerning, "Hourly Precipitation Data" on page 235 of this issue.

SAN FRANCISCO: 1952

CALIFORNIA - OCTOBER 1952

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 314 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 65.6° or 4.4° above the weighted mean. The unweighted average temperature based on the same 314 stations was 64.2° or 3.9° above the unweighted mean. The October unweighted average temperature was equaled or exceeded only two times in the period since 1897: 1917, 64.4°; 1933, 64.4°. The highest temperature, 112°, was recorded at Greenland Ranch in Death Valley on the 2nd. Boca at an elevation of 5535 feet in Nevada County reported the lowest temperature, 15°, on the 15th, 22nd, 23rd, and 25th.

The average precipitation for the State was much below normal. Based on 318 stations listed in Table 2 and weighted with respect to the areas of the various divisions, the average was 0.09 inch or 1.00 inch below the weighted mean. The unweighted average based on the same 318 stations was 0.09 inch or 1.12 inches below the unweighted mean. Based on 544 stations listed in Table 3 the unweighted average was 0.10 inch or 1.11 inches below the unweighted mean. The average precipitation for October was equal to or less than 0.09 inch in only three years since 1897: 1906, 0.09 inch; 1913, 0.08 inch; 1917, 0.01 inch. Round Mountain in Shasta County reported the greatest monthly total precipitation,1.11 inches. French Gulch in Shasta County recorded the greatest daily precipitation amount on the 18th, 0.91 inch. There were 264 stations reporting no precipitation, and 53 stations reporting only a trace.

Much-above-normal temperatures in the north coastal area during the first week resulted in further drying of soils and forage. Irrigation was necessary to maintain grasses in most districts. Moderate rainfall on the 18th was very beneficial for pastures and ranges; however, much more was needed.

Weather conditions in the central coastal area were generally favorable for harvesting of prunes, walnuts, grapes, and other crops.

Much-above-normal temperatures during the first week in the upper Sacramento Valley benefited prune harvesting and alfalfa drying activities but increased irrigation water requirements in pastures. Light precipitation on the 18th was beneficial for walnut harvesting. Continued dry weather throughout the month permitted considerable progress in land-leveling and soil-preparation activities. Daily maximum temperatures at Red Bluff on the 1st and 3rd exceeded any previous daily maximum temperatures for those dates at that station; daily maximum temperatures on the 2nd and 5th equaled the highest maximum temperature established for those dates with the maximum on the 5th also equaling the highest temperature on record so late in the season at Red Bluff.

Hot, dry weather in the lower Sacramento Valley during the first week was favorable for rapid maturing and ripening of crops. Some sunburn was noted in tomatoes. Generally, tomatoes ripened faster than they could be harvested or accepted by canneries. Pastures and ranges were reported very dry, and fire hazards increased. Low temperatures during the second week favored slower ripening of tomatoes. Fall grain seeding operations commenced during the month, and rainfall was needed to forestall reseeding later on. At Sacramento, October was the driest since 1932 and the warmest since 1933. The 102° maximum temperature on the second was the highest temperature ever recorded in October at Sacramento.

Much-above-normal temperatures in the lower San Joaquin Valley during the first week were most beneficial to raisin-drying activities. The lack of sufficient dew limited hay-cutting and hay-baling operations and generally made necessary the use of the new moisture-absorbing defoliants in cotton fields. At the end of the first week 85 percent of the Thompson seedless grape crop was reported dried and safe from the weather, but only about 50 percent of the Muscat crop. Hot, dry weather also benefited fig drying with an estimated 100 percent of the Calimyrnas and about 80 to 85 percent of the Adriatics dried. Generally moderate temperatures together with the lack of rainfall during the last three weeks resulted in highly favorable conditions for harvesting of truck and field crops. Heavy deposits of dew during the latter portion of the month made the use of defoliants such as calcium cyanamide practicable in cotton fields. Although the current stage of cotton picking at the end of the month was reported behind that of last year at that time, the harvesting tempo had increased with machine picking tending to replace the traditional hand picking method in most districts. Harvesting of the last cutting of alfalfa was slowed somewhat by heavy deposits of dew.

Hot weather in the upper San Joaquin Valley was favorable for crops. Cotton picking was in full swing. The lack of sufficient dew during the first two weeks made necessary the use of moisture-absorbing dusts or liquid defoliants for cotton defoliation. During the latter portion of the month adequate deposits of dew were ideal for cotton defoliation with calcium cyanamide and other defoliants requiring dew.

In the Santa Maria area warm weather together with high relative humidities contributed to some "sliming" of lettuce. Foggy weather in the Santa Barbara district on many days made drying of beans difficult. Generally, weather conditions were ideal for the development and harvesting of crops.

Weather in the Los Angeles area during the first week was generally too hot for fall potatoes. The new citrus crop was reported sizing satisfactorily with some sunburn of fruit and foliage. Cool, foggy weather in coastal districts slowed threshing of lima beans but permitted resumption of pest-control operations. Cooler weather during the last three weeks generally favored growing crops, harvesting activities, and pest-control operations. Irrigation water requirements were reduced somewhat. Seasonable weather prevailed in the San Diego area for the development and harvesting of crops.

In the Imperial Valley weather was too warm for lettuce causing some lettuce to go to seed. Otherwise, conditions were ideal for all new plantings and for cotton picking.

AVERAGES FOR THE PERIOD OCTOBER 1948 TO DATE HAVE BEEN WEIGHTED ACCORDING TO AREA AND ARE NOT COMPARABLE WITH UNWEIGHTED VALUES PUBLISHED IN THIS TABLE FOR EARLIER YEARS.

ANNOUNCING THE RESUMPTION OF PUBLICATION OF HOURLY PRECIPITATION DATA

Hourly precipitation data were published in Climatological Data through September 1951, at which time it was necessary to discontinue publication of hourly amounts, because of withdrawal of fiscal support.

Recent developments make possible the resumption of publication of these data in a new bulletin entitled "Hourly Precipitation Data". There will be one bulletin for each of the 42 climatological sections in the United States and one for Alaska. (Climatological sections correspond to States except that the six New England States comprise a single section and Maryland and Delaware comprise another.)

"Hourly Precipitation Data" will be issued monthly, with an annual summary issue. The first month to be published will be October 1951, and publications thereafter will be as rapid and as regular as funds permit. The price will be 10 cents per copy; $1.00 per year (including the annual). Checks and money orders for subscriptions should be made payable to the "Treasurer of the United States". Remittances and correspondence should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

See reference notes following Station Index.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F, precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Weather Bureau Stations where hours of duty prelude observations at this time in which case the time is 10:30 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

\- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5, is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

// Gage is equipped with a windshield.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

E Water equivalent to snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Daily precipitation values and monthly total from recording gage.

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Subscription Price: 15 cents per copy, monthly and annual; $1.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Treasurer of the United States. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

See note concerning, "Hourly Precipitation Data" on page 257 of this issue.

SAN FRANCISCO: 1953

CALIFORNIA - NOVEMBER 1952

E. L. Felton, Section Director - San Francisco

WEATHER SUMMARY

The average temperature for the State based on 311 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 49.1° or 2.9° below the weighted mean. The unweighted average based on the same 311 stations was 49.5° or 2.3° below the unweighted mean. The highest temperature, 100°, was recorded at Brawley in Imperial County on the 1st. The lowest temperature, -3°, was recorded at Soda Springs on the 28th.

The average precipitation for the State based on 312 stations listed in Table 2 and weighted with respect to the areas of the various divisions was 2.29 inches or 0.25 inch above the weighted mean. The unweighted average based on the same 312 stations was 2.64 inches or 0.39 inch above the unweighted mean. Based on 512 stations listed in Table 3 the unweighted average was 2.79 inches or 0.54 inch above the unweighted mean. The greatest monthly total precipitation, 6.91 inches, was reported from Cuyamaca in San Diego County. The greatest daily total, 4.29 inches,occurred at Cuyamaca on the 16th.

Snow Laboratory Central Sierra, at an elevation of 6902 feet in Nevada County reported the greatest monthly total snowfall, 42.0 inches. Twin Lakes at an elevation of 7920 feet reported 35.0 inches; Soda Springs at 6752 feet, 34.0 inches; Giant Forest at 6360 feet, 39.0 inches; Grant Grove at 6660 feet, 36.5 inches; Big Bear Lake Dam at 6800 feet, 41.5 inches, and Lodgepole Ranger Station at 6695 feet, 37.0 inches.

Rains in the north coastal area during the second week were very beneficial for crops, particularly grasses. By the end of the month fields were beginning to turn green as a result of the rains.

In the central coastal area harvesting of crops, particularly tomatoes, continued under favorable conditions during the first decade. Rains from the 12th to 15th were sufficient to moisten soils for fall seeding of grains. Harvesting of truck crops in most districts was slowed as a result of the precipitation. Grains were being planted later than usual due to the lateness of the fall rains. Precipitation during the last two days of the month was very beneficial for pastures, but low temperatures preceding the rains retarded growth of grasses. Heavy frosts killed tender vegetation and favored bringing fruits and grapevines into dormancy. Some light frost damage occurred in artichokes in Santa Cruz County.

Warm, dry weather in the upper Sacramento Valley during the first decade was beneficial for most fall harvesting operations, particularly for alfalfa and olives. The continued dry weather permitted considerable progress in soil-preparation and land-leveling operations. Above-normal temperatures favored growth of irrigated pastures, but lack of precipitation generally held up development of range grasses. Some wind and rain early in the month would have been helpful for walnut harvesting. Rains and wind from the 12th to the 16th were beneficial for walnut harvesting in shaking of nuts to the ground and splitting of hulls. Olive and cotton harvesting activities, however, were hampered by the precipitation. Most other farm operations were brought to a standstill during the wet weather. Range grasses, grains, and newly seeded alfalfa benefited greatly from the moisture added to the soil. Temperatures during the last week were generally too low for satisfactory growth of grains and range grasses. Conditions preceding rains on the 30th were generally favorable for harvesting of cotton and walnuts. Movement of cattle from summer ranges at higher elevations to lower valley ranges was under way by the end of the month.

Dry weather in the lower Sacramento Valley during the first 11 days was generally detrimental to foothill pastures and newly seeded grains but quite favorable for rice threshing and picking of tomatoes. The lack of early rainfall resulted in a delay in starting of grasses and other green feed for livestock. Rains from the 12th to the 15th delayed late harvesting of rice, corn, milo, and beans. Sugar beet digging was also temporarily stopped. Barley, wheat, oats, and new alfalfa planting activities proceeded rapidly until rains interrupted operations. Generally clear weather with dry, northerly late harvesting of rice and beans and seeding of grains. Cold nights in foothill and mountain districts were unfavorable for growth of grasses. Tomato and grape harvesting was generally terminated with the frost on the 17th. Heavy frosts during the last week resulted in excellent defoliation in orchards permitting considerable pruning and spraying.

The extended period of above-normal temperatures in the lower San Joaquin Valley continuing through the 13th, together with the absence of precipitation, was particularly beneficial to cotton. Some cotton acreages were not harvested during the first portion of the month due to the lack of sufficient dew required to permit defoliation with defoliants requiring moisture in the form of dew. Raisin harvesting was completed. Above-normal temperatures were generally unfavorable for coloring of Emperor grapes, consequently, picking of these grapes was slowed somewhat. Rains from the 14th to 16th interrupted cotton and grape picking. Rains resulted in some damage to cotton by dirt splashing on lower bolls of good stands and most bolls on stunted plants but greatly benefited grasses and other forage on pastures and ranges. Heavy frosts during the last week resulted in complete defoliation of cotton plants and contributed to a speed-up of harvesting. About 80 percent of the cotton crop was reported harvested before interruption by rains at the end of the month.

In the upper San Joaquin Valley generally favorable weather prevailed during the first 13 days for harvesting of cotton, potatoes, tomatoes, sweet corn, and other crops. The over-all effects of the precipitation from the 14th to 16th were more favorable than detrimental. Rains were beneficial for range grasses and for soils being prepared for early spring potatoes but were detrimental to cotton, particularly to stacks of cotton on the ground in the fields. The cotton crop was reported only about 60 percent harvested when the rains occurred. Weather during the latter portion of the month was generally favorable for crops and harvesting activities.

Cool weather with considerable fog and low clouds in the Santa Maria area contributed to mildew in some crops. Damp weather also slowed bean threshing operations. Rains on the 13th to the 15th were detrimental for bean harvesting; however, bean harvesting was nearly completed in most districts. Precipitation was very beneficial in adding moisture to the soils for peas, barley, oats, and wheat, which were to be planted.

The absence of killing frosts during the first decade in the Los Angeles area permitted continued harvesting of late tomatoes. Rains on the 6th, 7th, and 8th were beneficial for pastures, range lands, and field crops. Moderate to heavy rains on the 14th and 15th soaked soils and benefited vegetation, particularly grains and grasses. All irrigation operations were suspended. Some local flooding and erosion damage was caused by heavy showers. Strong winds resulted in some minor structural damage in the metropolitan area. Some unthreshed lima beans in the Moorpark district were damaged to some extent by the rains. Light frosts in many districts during the latter portion of the month resulted in killing of tender plants. Some scattered, light orchard heating for lemons was reported. Generally, the cool weather was beneficial for coloring navel oranges.

Slight damage was reported to citrus and avocado trees in exposed districts of San Diego County by warm, east winds, during the first week. Rains and strong winds during the third week resulted in some damage to bell peppers, late tomatoes, and green beans. Some wind damage was sustained by avocadoes, and a few trees were blown down. Rains were particularly beneficial to celery and lemons with benefits of the rain far exceeding damages resulting from strong winds. Cool weather during the latter half of the month contributed to lowering the quality of tomatoes.

In the Imperial Valley warm weather during the first week was unfavorable for lettuce with some bolting of lettuce reported. The high temperatures and light winds were ideal for cotton harvesting and the development of new alfalfa. Cool weather during the latter half of the month was very favorable for lettuce and carrots.

AVERAGES FOR THE PERIOD OCTOBER 1948 TO DATE HAVE BEEN WEIGHTED ACCORDING TO AREA AND ARE NOT COMPARABLE WITH UNWEIGHTED VALUES PUBLISHED IN THIS TABLE FOR EARLIER YEARS.

ANNOUNCING THE RESUMPTION OF PUBLICATION OF HOURLY PRECIPITATION DATA

Hourly precipitation data were published in Climatological Data through September 1951, at which time it was necessary to discontinue publication of hourly amounts, because of withdrawal of fiscal support.

Recent developments make possible the resumption of publication of these data in a new bulletin entitled "Hourly Precipitation Data". There will be one bulletin for each of the 42 climatological sections in the United States and one for Alaska. (Climatological sections correspond to States except that the six New England States comprise a single section and Maryland and Delaware comprise another.)

"Hourly Precipitation Data" will be issued monthly, with an annual summary issue. The first month to be published will be October 1951, and publications thereafter will be as rapid and as regular as funds permit. The price will be 10 cents per copy; $1.00 per year (including the annual). Checks and money orders for subscriptions should be made payable to the "Treasurer of the United States". Remittances and correspondence should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D. C.

See reference notes following Station Index.
